ASSIGNMENT-2

1. Grade Checker

Take a score as input and print the grade based on the following:

90+ : "A"

80-89 : "B"

70-79 : "C"

60-69 : "D"

Below 60 : "F"

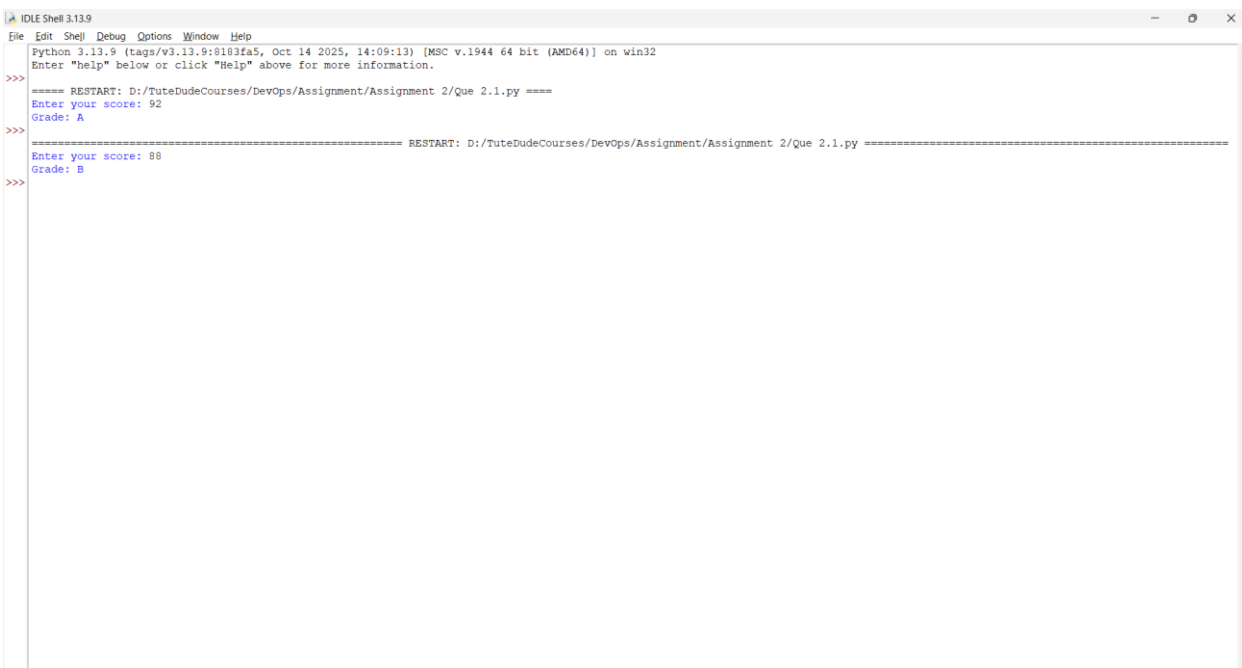
here we used a basic if else statement to carry out marks and all.

ANS 1:

```
# Grade Checker Program

score = int(input("Enter your score: "))

if score >= 90:
   print("Grade: A")
elif score >= 80:
   print("Grade: B")
elif score >= 70:
   print("Grade: C")
elif score >= 60:
   print("Grade: D")
else:
   print("Grade: F")
```



2 Student Grades
Create a dictionary where the keys are student names and the values are their grades. Allow the user to:
Add a new student and grade.
Update an existing student's grade.
Print all student grades.

Used dictionary and basic operations. Using if else:

ANS 2:

```
# Student Grades Program
students = {}
while True:
    print("\n1. Add Student")
    print("2. Update Student Grade")
    print("3. Print All Student Grades")
    print("4. Exit")

    choice = input("Enter your choice (1-4): ")

    if choice == "1":
        name = input("Enter student name: ")
        grade = input("Enter student grade: ")
        students[name] = grade
        print("Student added successfully!")
    elif choice == "2":
        name = input("Enter student name to update: ")
        if name in students:
            grade = input("Enter new grade: ")
            students[name] = grade
            print("Grade updated successfully!")
        else:
            print("Student not found!")
    elif choice == "3":
        if students:
            print("\nStudent Grades:")
            for name, grade in students.items():
                print(name, ":", grade)
        else:
            print("No students in the record.")
    elif choice == "4":
        print("Exiting program...")
        break
    else:
        print("Invalid choice! Please select 1-4.")
```

Exiting program
```

3.Write to a File
Write a program to create a text file and write some content to it.

Using file functions like write and open.

ANS 3:

```
# Write to a File Program

file = open("sample.txt", "w")  # "w" mode creates the file (or overwrites if it exists)

file.write("Hello, this is a sample text file.\n")
file.write("This file was created using Python.\n")
file.write("We are learning file handling.\n")

file.close()  # Always close the file

print("Content written successfully to sample.txt")
```

4. Read from a File
We used open in read mode and file.read to read and print to display.

ANS 4:

```
# Read from a File Program

# Open the file in read mode
file = open("sample.txt", "r")  # "r" mode is for reading

# Read the entire content
content = file.read()

# Print the content
print("File Content:\n")
print(content)

# Close the file
file.close()
```
